## 5 years plan

Astrophysics Archives Project  
Proposal  
The NASA Astrophysics

### Accelerating Discovery Enhanced Information

Alberto Accomazzi, Michael J. Kurtz, Ed  
Center for Astrophysics  
3 February

#### Executive Summary

The NASA Astrophysics Data System (ADS) is a digital library 27 years ago, and has reconnected the network for astrophysics research for many years in space, despite massive changes in the way scientists disseminate their results. These changes have moved from an experimental facility into a stable, robust system. Policies reflect the needs and priorities of the community.

The last five years have seen substantial changes. A new management structure, has developed. ADS has migrated its community of 50,000 users to a new state-of-the-art search engine, a modern interface, and access to the ADS data collections and services developed following an open source model.

The ADS's mission is aligned with NASA's goal to increase knowledge by enabling open science and research. The ADS has a unique role with respect to the scientific literature to help researchers explore their connections. As interdisciplinary research becomes organically connected and discovered, the ADS increases discoverability of both and

**1. Improve Discovery.** Combining improved metadata such as derived from named entity and concept extraction (He et al. 2019; Zhao et al. 2019, see section 3.1.4) with new graph-based clustering (Traag et al. 2019) promises new powerful avenues for human-machine interactions. Likewise, combining the full text of articles with the new context-sensitive vector space literature models (Devlin et al. 2018; Peters et al. 2018) will enable the use of language models to improve the efficiency and accuracy of scholarly information retrieval. These recent advances in the field of NLP and AI provide an opportunity for the ADS to significantly improve its ability to better disambiguate the content it indexes and better understand the intent behind a user query, which translates into more relevant results (see section 3.2.4). As the number of articles in the literature increases (and the relevant signal gets buried in a constantly increasing noise), **we intend to use state-of-the-art NLP techniques to improve our search, recommendation and notification systems.**

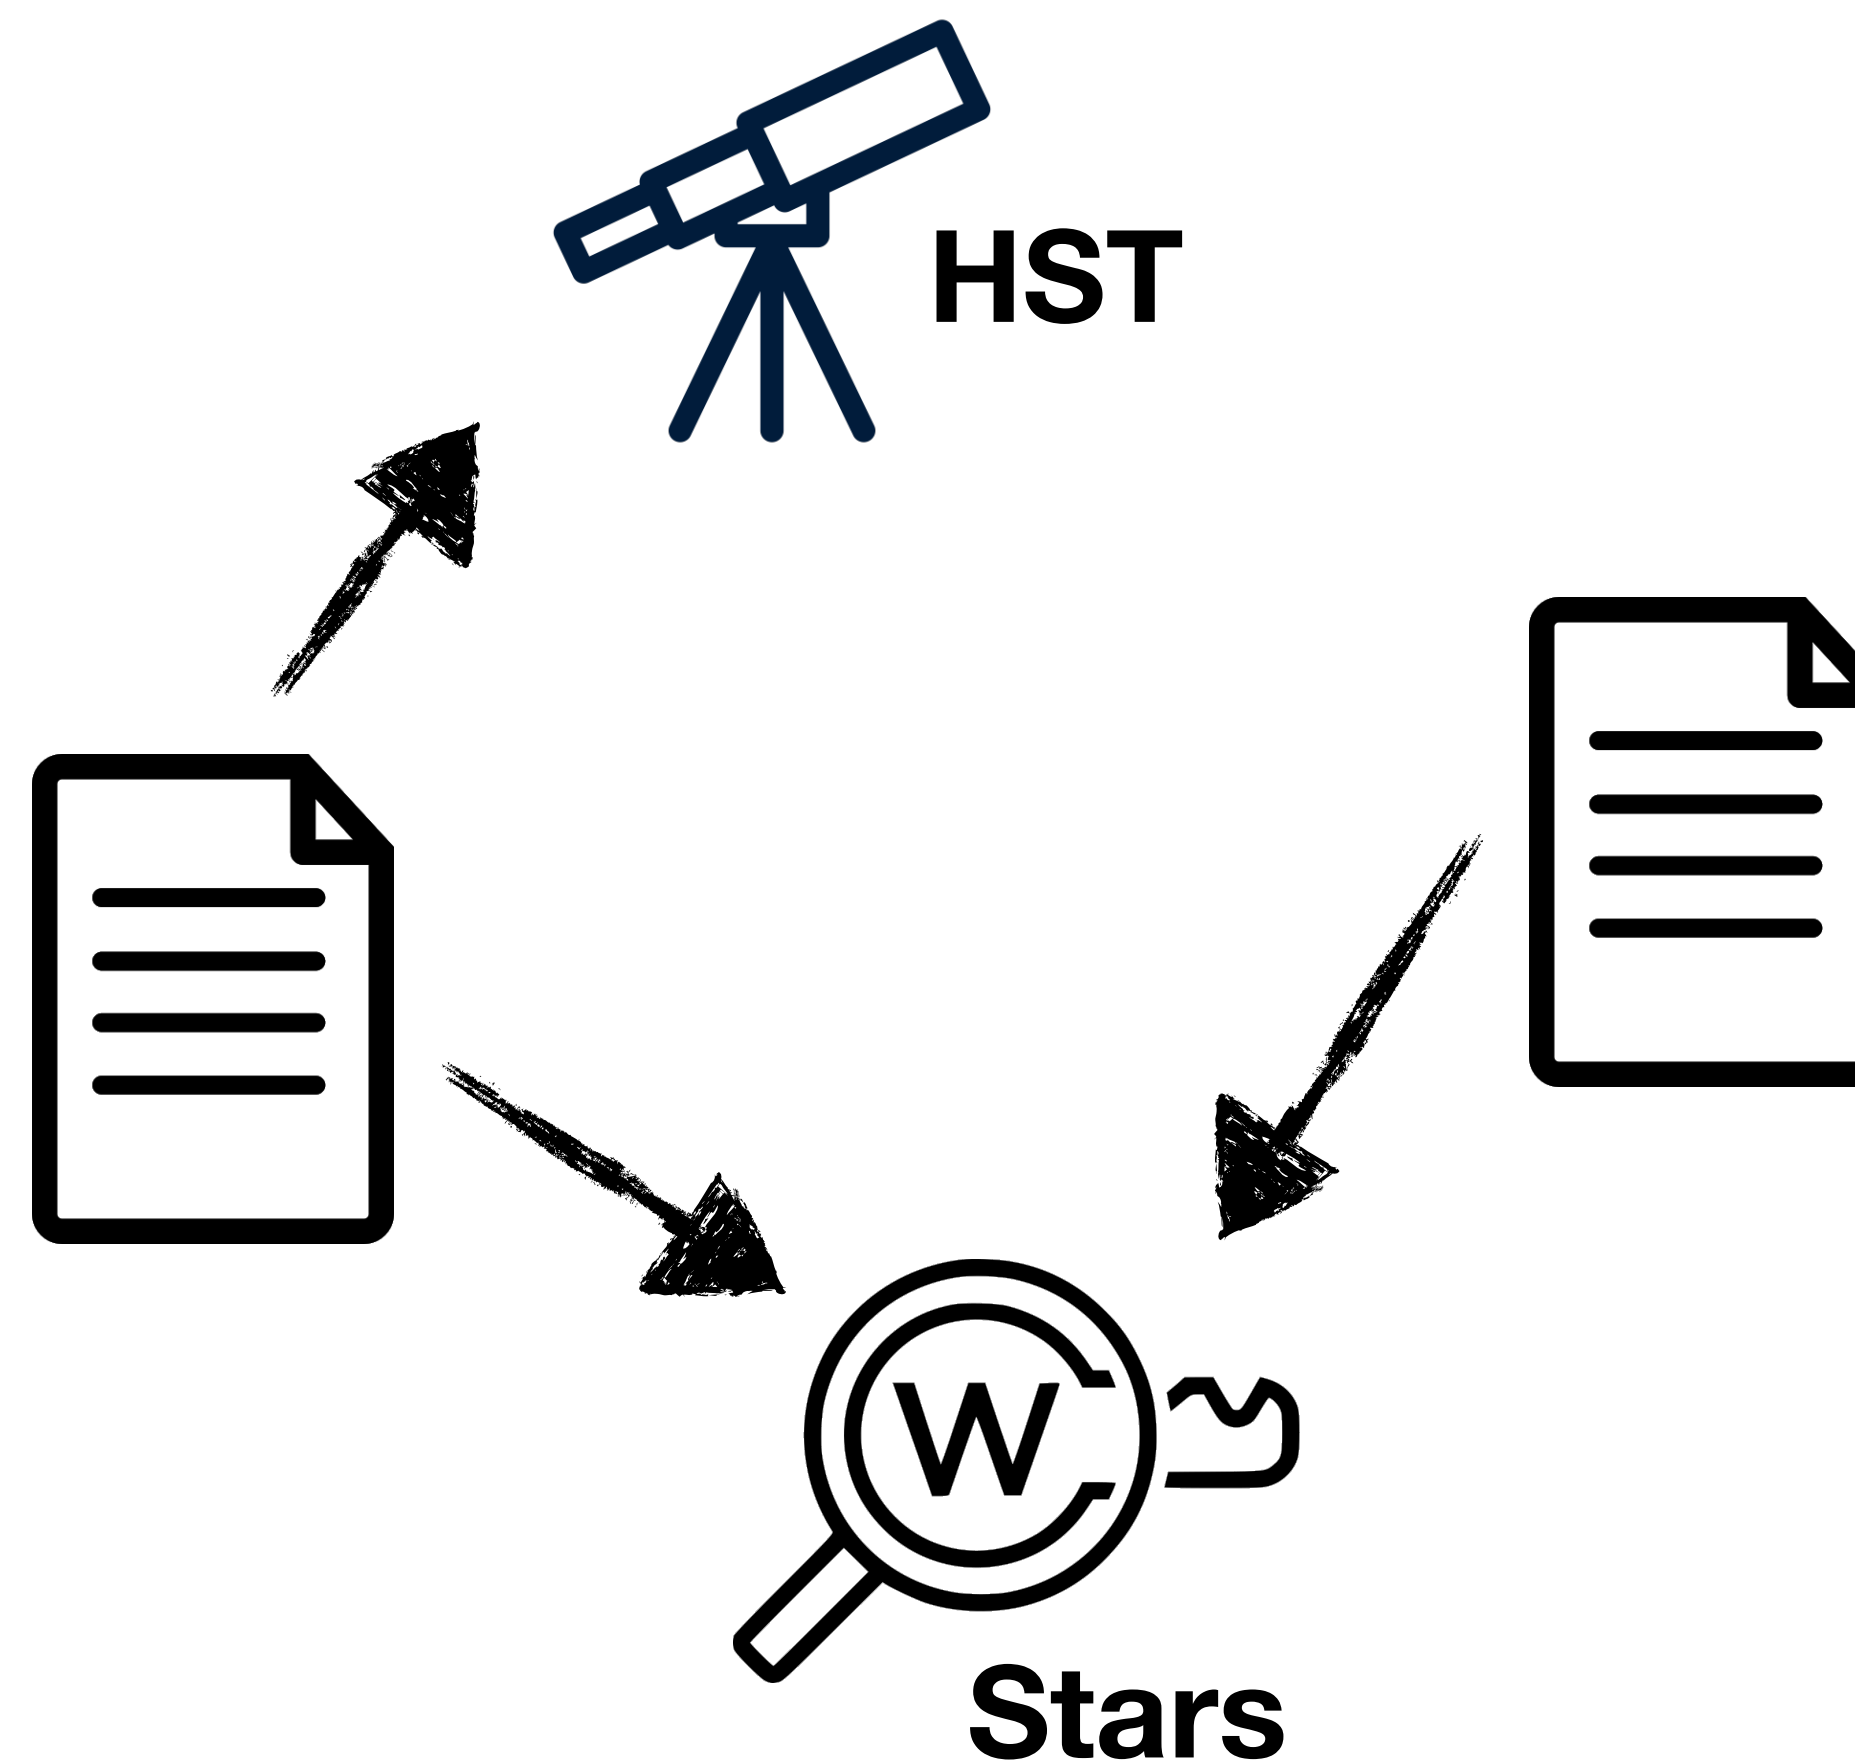

# Senior Review 2020

**5 years plan**

- Link papers to facilities and Unified Astronomy Thesaurus (UAT) terms

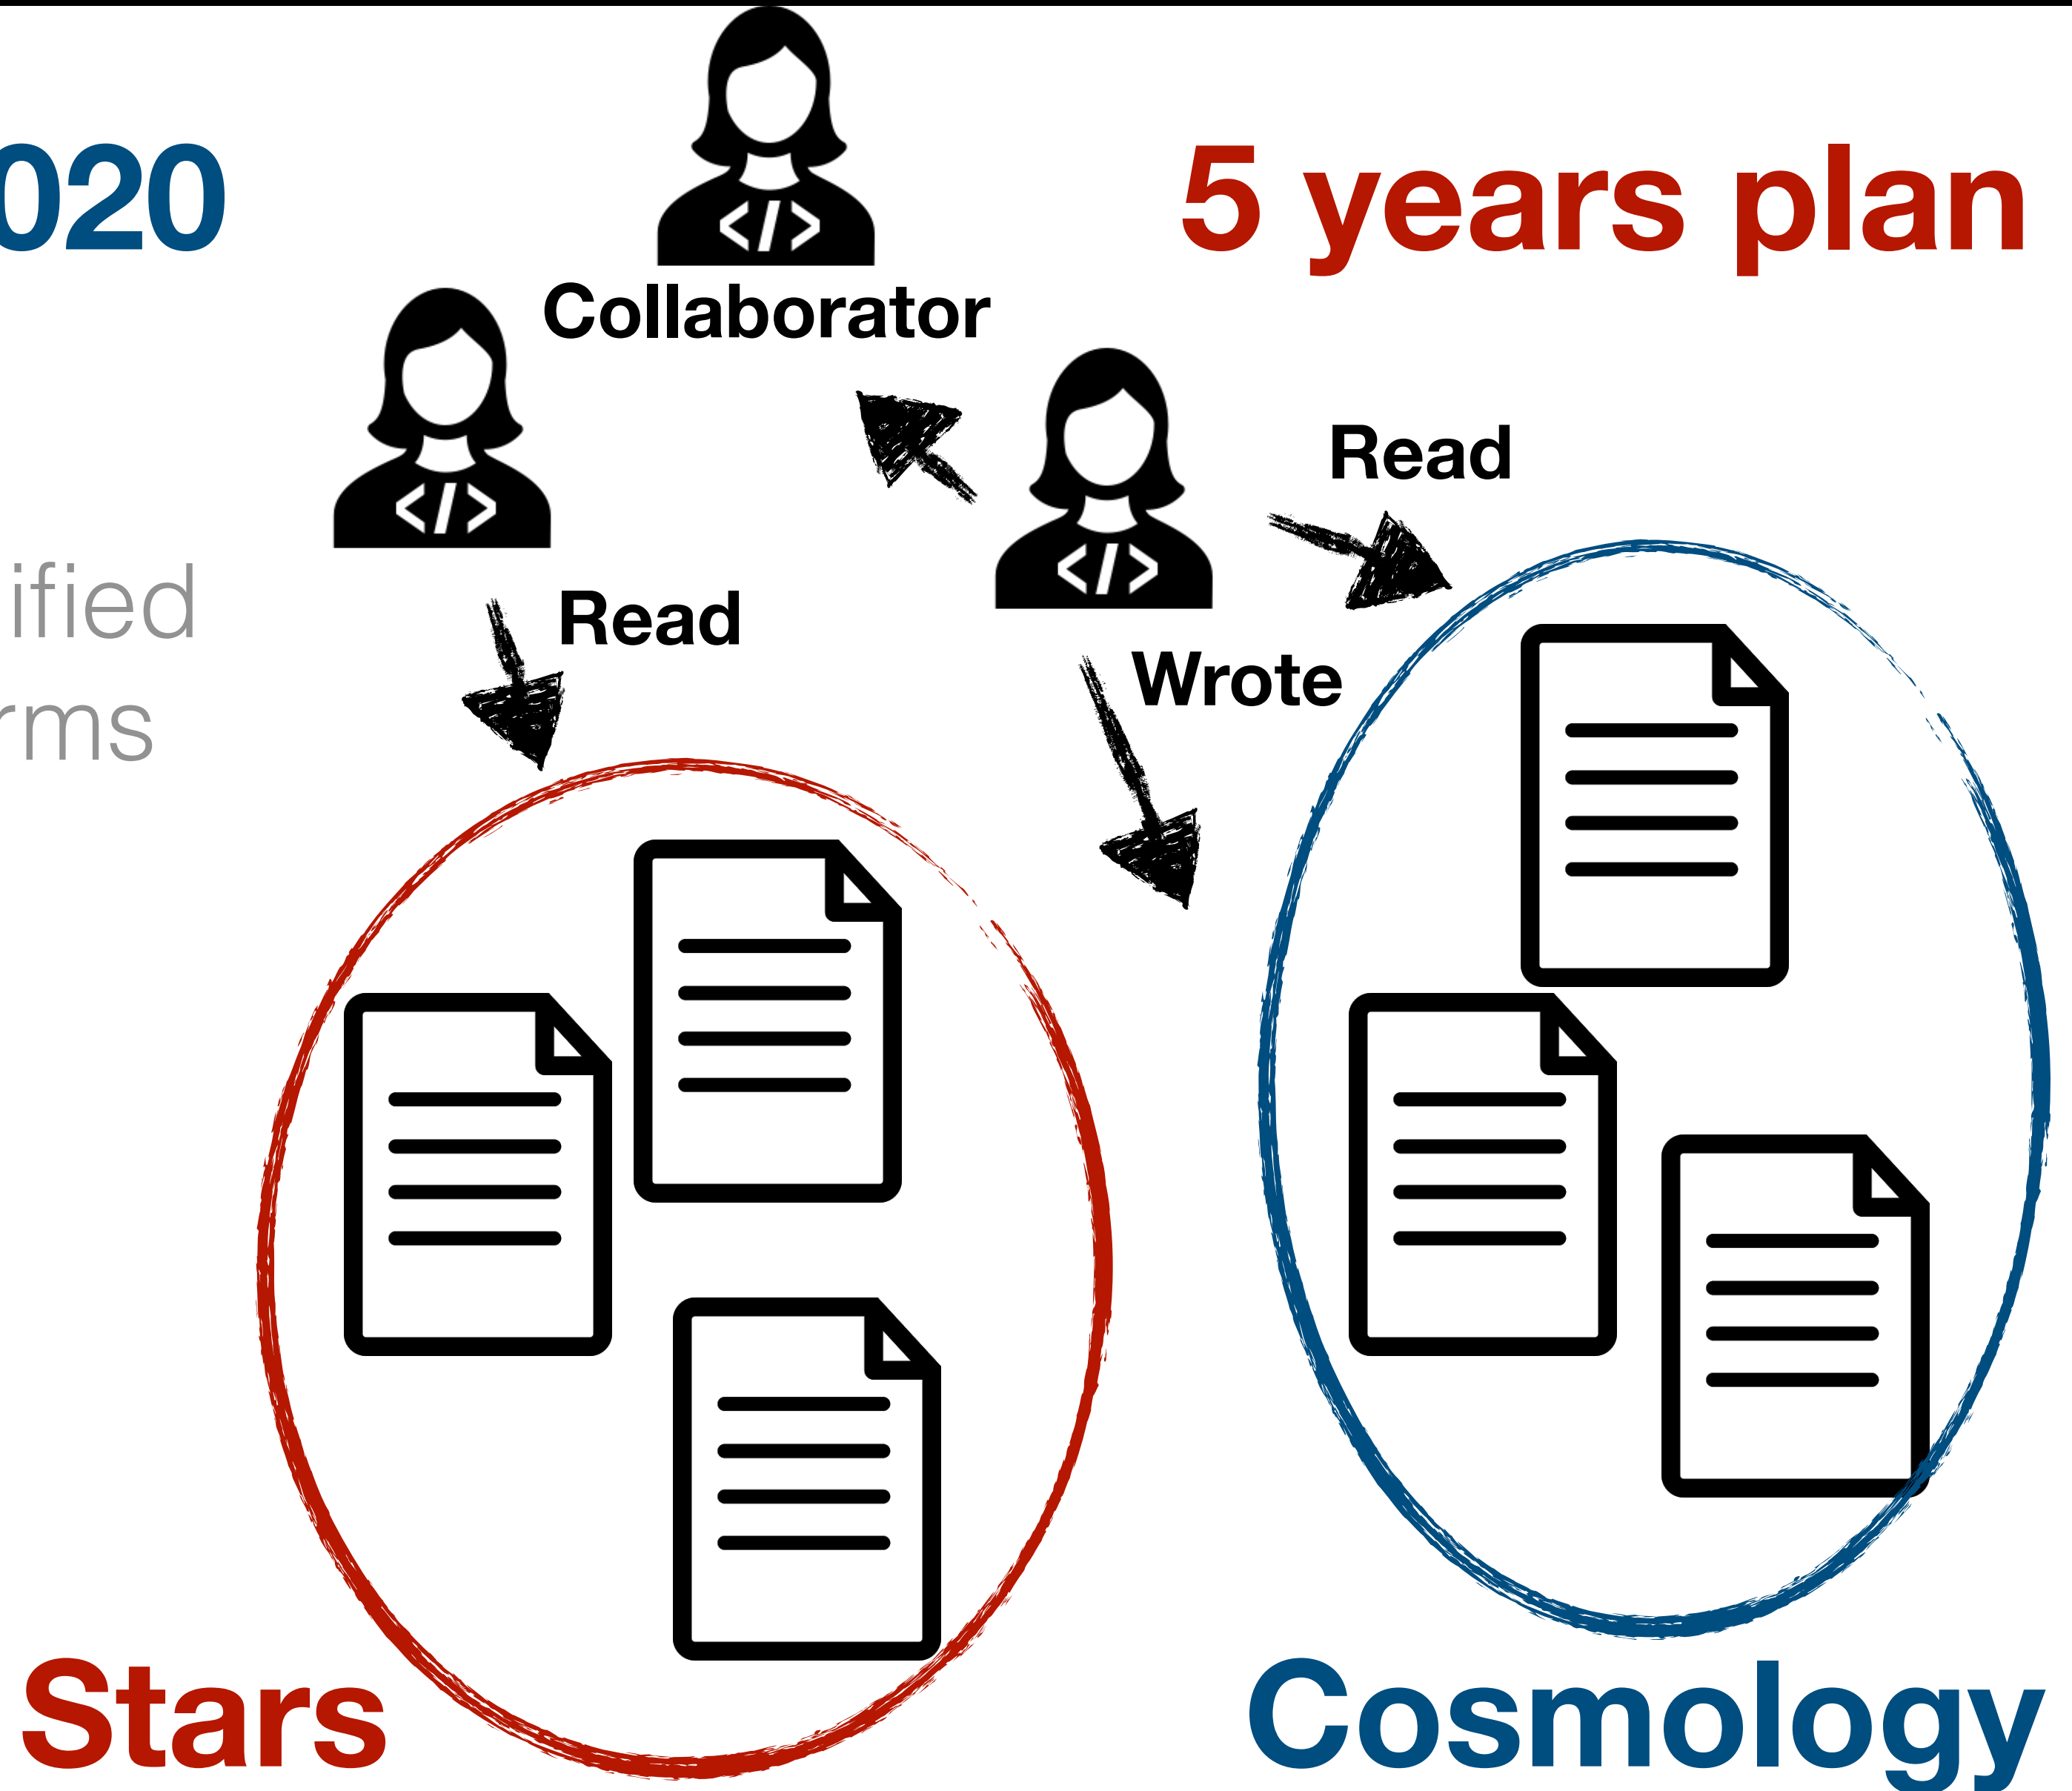

# Senior Review 2020

- Link papers to facilities and Unified Astronomy Thesaurus (UAT) terms
- Implement an advanced recommendation system

**5 years plan**

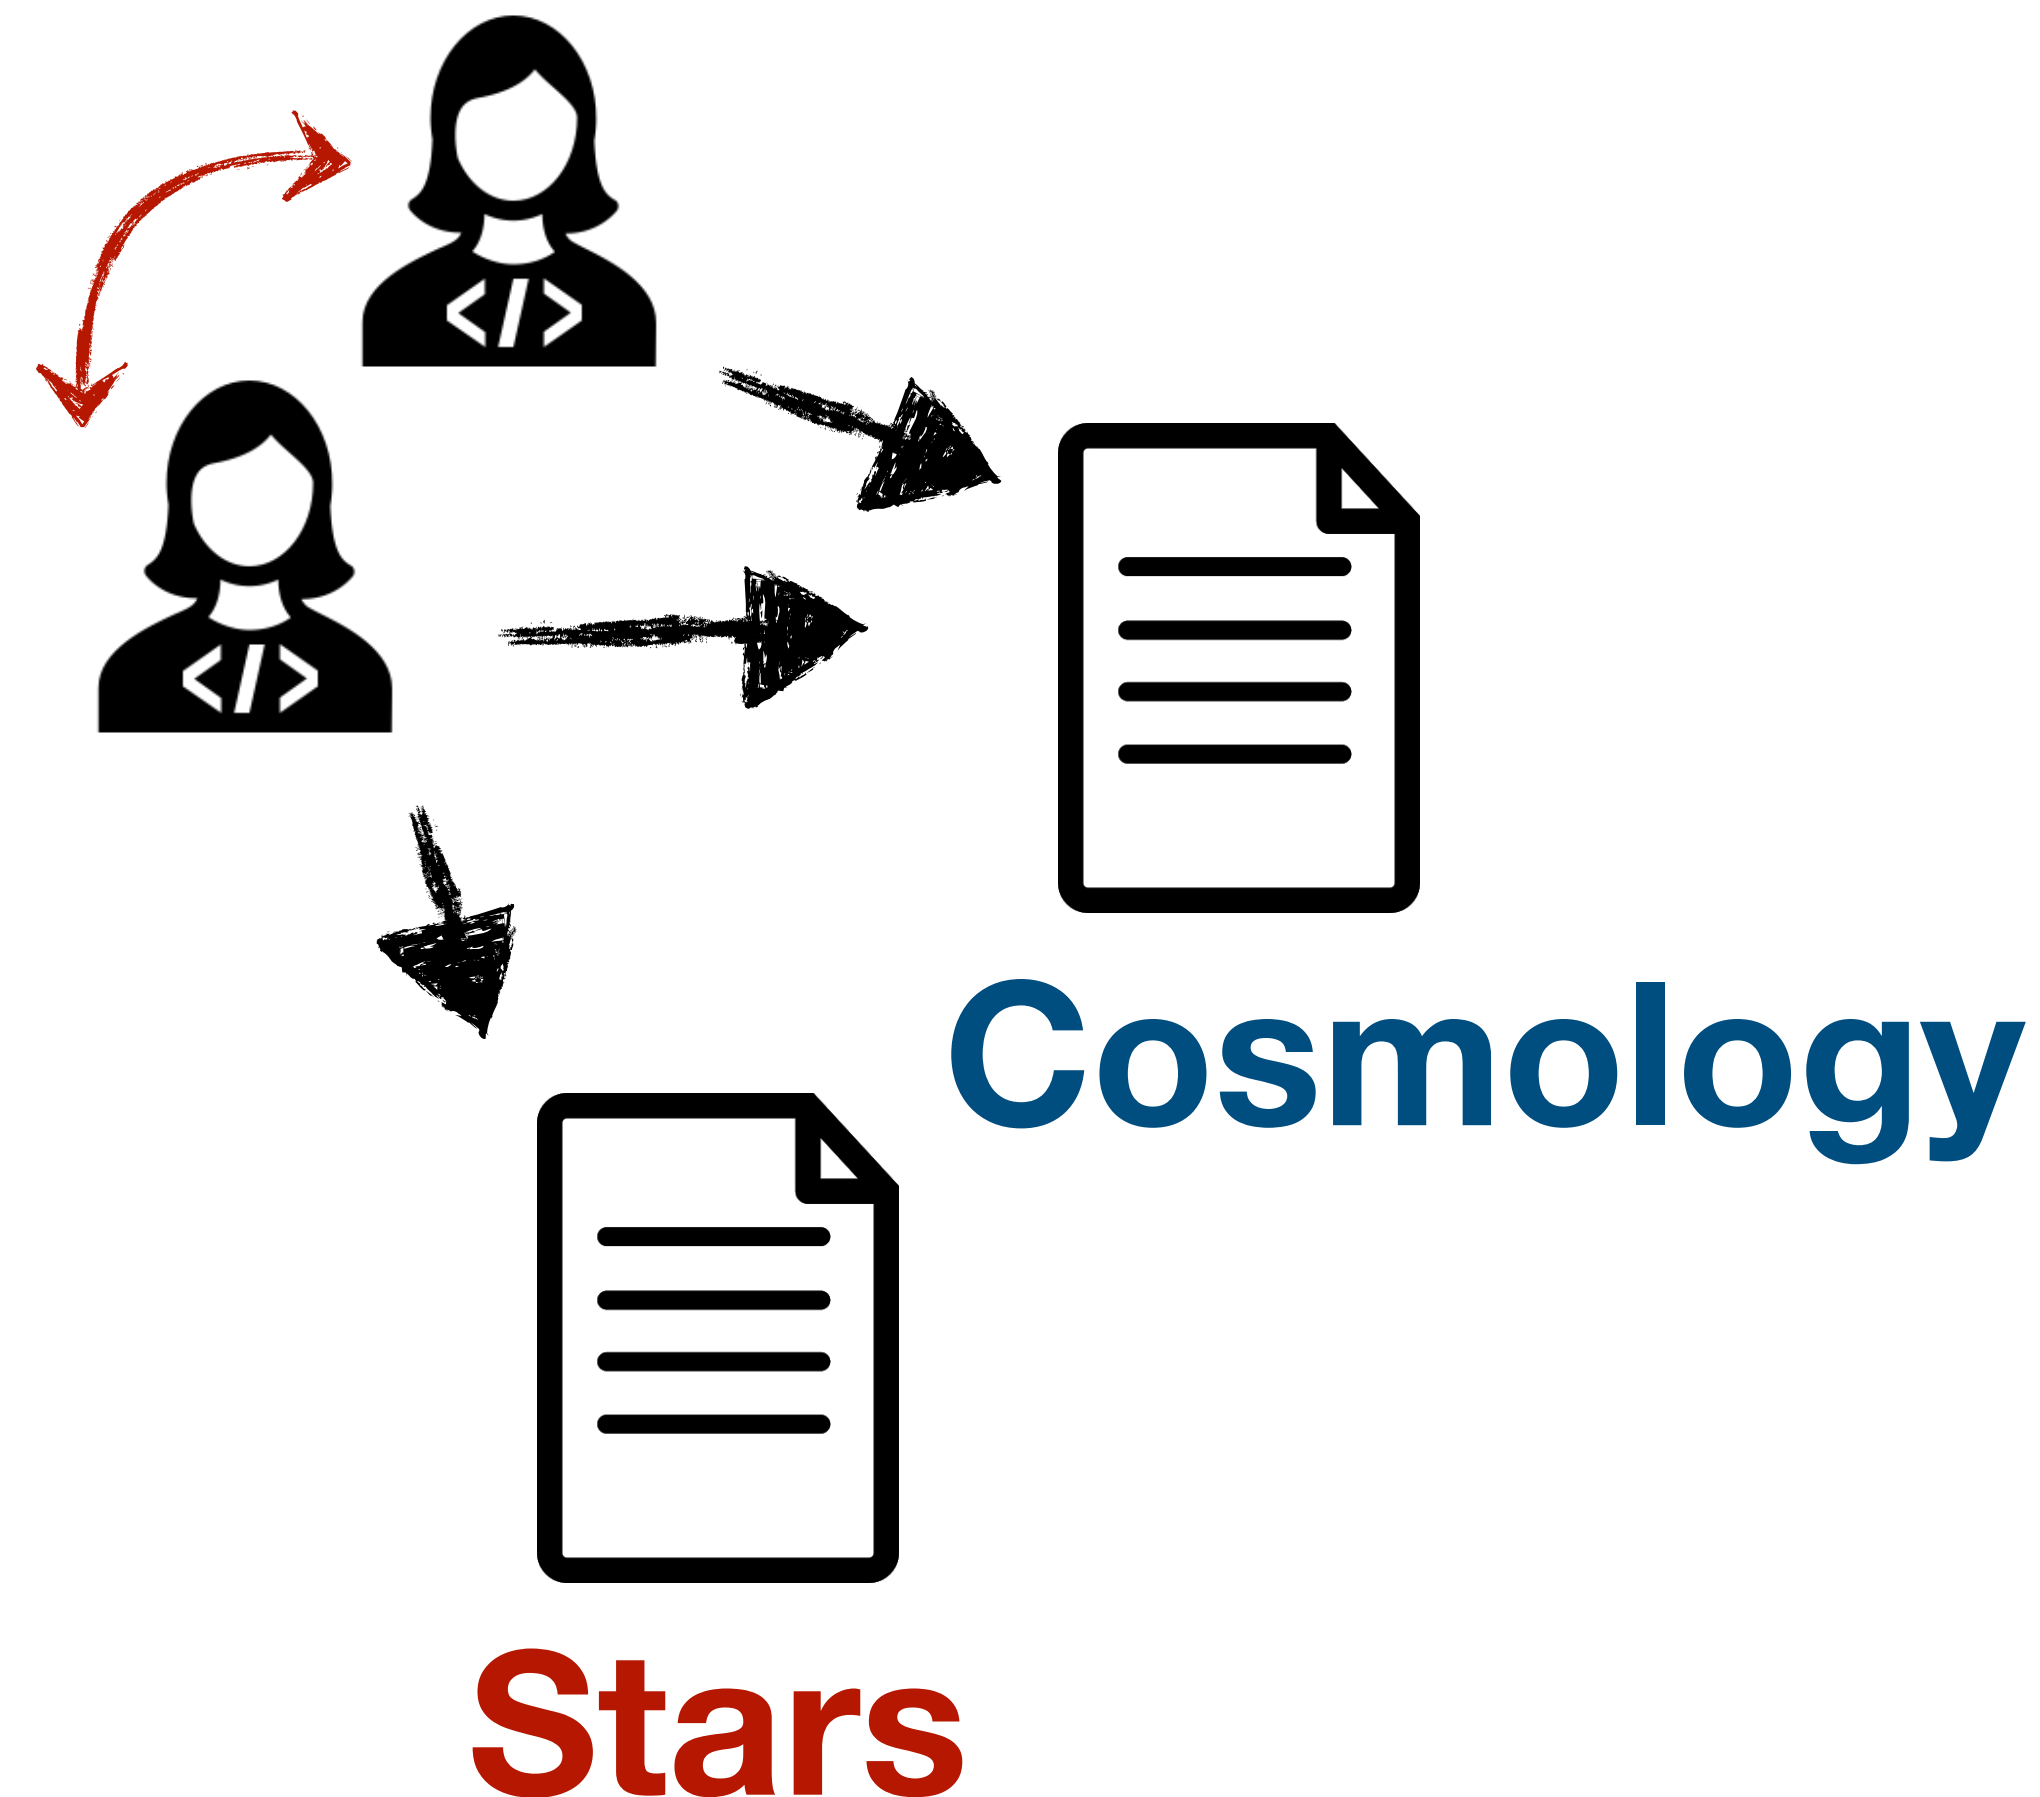

## Senior Review 2020

**5 years plan**

- Link papers to facilities and Unified Astronomy Thesaurus (UAT) terms
- Implement an advanced recommendation system
- Disambiguate authors (e.g., Is this your paper?)

## Summary

### Improve discovery

- Link papers to facilities and Unified Astronomy Thesaurus (UAT) terms
- Implement an advanced recommendation system
- Disambiguate authors (e.g., Is this your paper?)

**5 years plan...**
